

FireVu 3 - Visual Smoke Detection System

Turn your existing security cameras into a fire detection system

The FireVu Mark 3 is the most reliable and technologically advanced video smoke and flame detection system available.

-  **FireVu 3** can be installed in your existing CCTV network making it inexpensive to deploy and run.
-  **FireVu 3** provides fast fire detection at its source
-  **FireVu 3** enables both security and active fire safety on your existing security cameras*

FireVu 3 is an advanced embedded Video Smoke Detection (VSD) server designed to operate over an IP network. Using advanced, mathematical algorithms it is capable of determining the presence of smoke within each of its eight available analogue camera inputs.

Operators can be alerted either remotely over the system's network or local to the unit via relay outputs.

Each camera image can have up to 16 fully independent, configurable zones, allowing the user complete flexibility on setting up the areas to be protected with their required sensitivity levels.

System configuration is carried out via a series of web pages using an internet browser, while system monitoring and reviewing is carried out using NetVu ObserVer client software.

**Based on quality cameras to VFD specifications*

Suppliers of fire protection systems looking to expand or upgrade their product and services solutions, please call us today to discuss how you can add this market leading system to your range.
